The design of IBM's 4341 Processor, as with other processors, involved many cost/performance tradeoffs. The designer is continually under pressure to increase processor speed without increasing cost or to decrease processor cost without decreasing performance. This paper will examine some of the engineering decisions that were made in the attempt to make the 4341 a high-performing yet low cost processor. These decisions include searching for, or developing, algorithms that make t ...

With the ever-increasing pervasiveness of the Internet and its stringent performance requirements, network system designers have begun utilizing specialized chips to increase the performance of network functions. To increase performance, many more advanced functions, such as traffic shaping and policing, are being implemented at the network interface layer to reduce delays that occur when these functions are handled by a general-purpose CPU. While some designs use ASICs to handle network functio ...
